**Related Rates Problem**

1. **Draw a picture.** Remember that the woman's shadow is on the ground in front of her; we'll use  $y$  for this distance. The distance from the base of the lamppost to the woman is  $x$ . We need variables for both of these distances, since they are changing.

2. **Define what we have and what we want when.** We have the rate the woman walks from the lamppost:  $\frac{dx}{dt} = 6$ . Now this is tricky: to get the rate of the length of her shadow increasing, we want  $\frac{dy}{dt}$ , but if we want the rate of the tip of her shadow increasing, we want  $\frac{d(x+y)}{dt}$ . (This is because we need to measure the tip of the shadow in reference to the base of the lamppost.) We also have the height of the woman (5 feet), and we know that when the woman is 6 feet from the lamppost ( $x=6$ ), and her shadow is 8 feet ( $y=8$ ). It turns out that we will need the height  $h$  of the lamppost to get the equation we need to differentiate, so from similar triangles, we can get this: (see last triangle to the left):

$$\frac{\text{side of large } \Delta}{\text{side of small } \Delta} = \frac{\text{bottom of large } \Delta}{\text{bottom of small } \Delta}; \quad \frac{h}{5} = \frac{x+y}{8}; \quad h = 8.75.$$

3. **Determine what equation we need:** We need to relate  $x$  and  $y$  to what we know ( $h$  and woman's height), which we can do using similar triangles again:  $\frac{8.75}{5} = \frac{x+y}{y}$  or (simplified),  $3.75y = 5x$

4. **Differentiate with respect to time:**  $3.75 \frac{dy}{dt} = 5 \frac{dx}{dt}$

5. **Plug in what we know at the time we know it, and solve for what we need:** Now plug in:  $3.75 \frac{dy}{dt} = 5 \frac{dx}{dt}$ ;  $3.75 \frac{dy}{dt} = 5(6)$ ;  $\frac{dy}{dt} = 8$  feet per second. This is the rate of the length of the shadow.

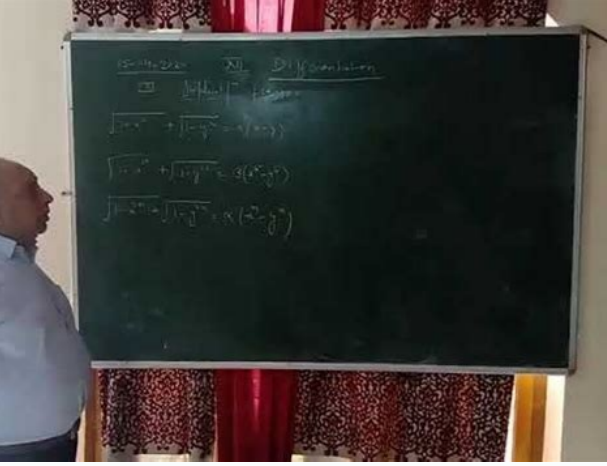

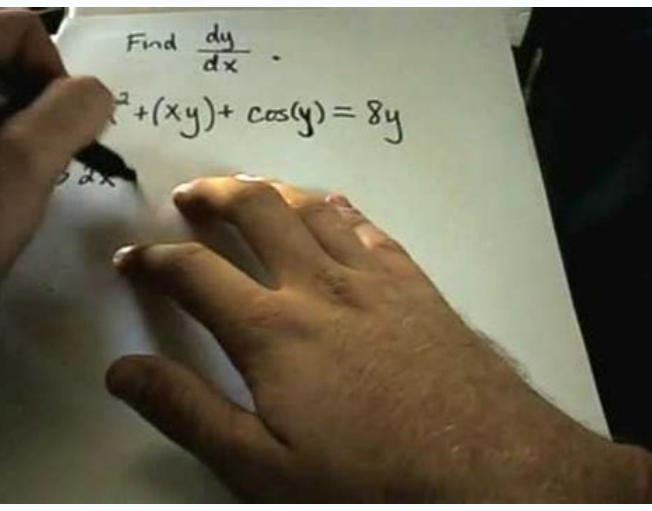

6. To get the rate of the tip of the shadow, we need  $\frac{d(x+y)}{dt}$ , which is actually  $\frac{dx}{dt} + \frac{dy}{dt}$ . So the rate of the tip of the shadow is  $6 + 8 = 14$  feet per second.

## Differentiation - 14

**Differentiation Of Implicit Function & It's Questions**

Class 12th Live at Indorikart Pathshala

CBSE / MP / IIT -JEE 2020

**Solutions**

Find an expression in terms of  $x$  and  $y$  for  $\frac{dy}{dx}$ , given that:

a)  $x^2 + y^2 = 4$

$$2x + 2y \frac{dy}{dx} = 0$$

$$2y \frac{dy}{dx} = -2x$$

$$\frac{dy}{dx} = \frac{-2x}{2y}$$

$$\frac{dy}{dx} = \frac{-x}{y}$$
  

b)  $y^2 = 2x$

$$2y \frac{dy}{dx} = 2$$

$$\frac{dy}{dx} = \frac{2}{2y}$$

$$\frac{dy}{dx} = \frac{1}{y}$$
